Abstract of JP 3084959 (A)

PURPOSE: To set a mode without installing a proprietary terminal and without making an external circuit complicated by providing the following: a Hall element which detects a magnetic field; a mode changeover circuit which changes an operating mode by this detection output; and a magnet installed so as to be freely detachable.

CONSTITUTION: A Hall element 1 detects a magnetic field from the outside of a package of an integrated circuit. The Hall element 1 is connected to a mode changeover circuit 2; the mode changeover circuit 2 instructs a mode changeover by a magnetic-field detection output from the Hall element 1. The mode changeover circuit 2 is connected to a circuit main body 3 and changes its operating mode by an input from the mode changeover circuit 2. The Hall element 1, the mode changeover circuit 2, and the circuit main body 3 are built in a package 4; a magnet 5 is installed at the outside of the package 4 so as to be freely detachable.
